

Visualizing Housing Market Trends: An Analysis of Sale Prices and Features using Tableau

CHAPTER – II

IDEATION PHASE

2.1 problem statement

The housing market generates large volumes of data related to property sale prices, location, size, number of bedrooms and bathrooms, year built, and other features. However, analyzing this data to understand pricing trends and the influence of various property characteristics can be complex and challenging. Traditional data analysis methods often fail to clearly represent relationships, patterns, and comparisons within large real estate datasets.

There is a need for an effective method to transform raw housing data into meaningful insights that are easy to interpret. Without proper visualization, buyers, sellers, investors and real estate professionals may struggle to identify key factors that impact sale prices or recognize market trends over time.

Therefore, this project aims to address the problem by using Tableau to create interactive visualizations and dashboards. The goal is to analyze the relationship between sale prices and property features, identify significant pricing patterns, and support data-driven decision-making in the housing market.

Visualizing Housing Market Trends: An Analysis of Sale Prices and Features using Tableau

Problem Statement

The Challenge

Analyzing housing market data is complex due to large volumes of information on **prices**, **locations**, **sizes**, and **property features**.

Large & Complex Data
Difficult to interpret patterns.

Unknown Price Factors
Hard to identify key influences.

Lack of Clear Insights
No effective visual representation.

How can we better visualize housing market trends and understand the factors affecting sale prices?
