3.4 – Technology Stack

The project "Visualizing Housing Market Trends: An Analysis of Sale Prices and Features using Tableau" is developed using a structured technology stack that supports data collection, processing, analysis, and visualization.

The primary visualization tool used in this project is Tableau. "Tableau is used to create interactive dashboard as, charts, trend lines, and filters that help analyze housing sale prices and property feature effectively. It enables real-time data visualization and easy dashboard sharing.

The dataset used for analysis is stored in CSV or Excel format and can also be managed using relational database systems such as MySQL or Microsoft SQL Server: These databases help in organizing large housing datasets and performing structured queries.

For data cleaning and preprocessing, tools like Microsoft Excel and Python are used. Python libraries such as Pandas and Num Py assist in handling missing values, formatting data, and preparing it for visualization.

The system requires a computer with a minimum Intel i5 processor; 8GB RAM, and sufficient storage to handle datasets efficiently. The final dashboards can be deployed and shared using Tableau Public or Tableau Server, making the analysis accessible through web browsers.
